

Data Visualization

Deliverable 2

Data storytelling aims to tell a story through visualization. The second deliverable of the semester project will evaluate the storytelling of the chosen dataset.

This deliverable will correspond to only one A4 page—legend included—in which the group must provide as much information as possible, extracted from the chosen data set. The groups must balance the cognitive burden of readers and the quality of content, colors, and graphics. The deliverable must be completely in Spanish or English. The percentage of this deliverable is 20% of the final evaluation of the semester project.

The groups can submit their deliverables on Canvas until May 20th at 23:59.

The evaluation will consider the following aspects:

- Quality of figures in terms of clarity, consistency of font sizes throughout the document, and the selection of colors (1 pts)
- The complexity of the analyses chosen (2 pts)
- The interplay and complementarity of each graph (1 pt)
- The message obtained from the figures is clear from a non-specialized audience (1 pt)
- The legend content is detailed (1 pt)

Additionally, the evaluation will consider the concepts of ugly, bad, and wrong, as explained in the lectures, as a form to evaluate the graphs.

The number of graphics is unlimited. However, a successful deliverable should contain **at least six plots**; one of them must visualize a measure of growth (e.g., GDP growth with respect to last year) as a feature, and one of the plots **must be** either a Sankey diagram or a radar plot. **Each plot type included in the deliverable can be repeated at most twice.** To clarify, a bar plot and a stacked bar plot are considered the same plot type.

Additionally, for every two detectable spelling errors in the review, 0.1 points will be deducted from the report grade, with a maximum deduction equivalent to 2 points.

After the completion of this deliverable, we expect to contribute to the completion of the following learning outcome (defined in the syllabus of the course):

R1. Evaluate and set up automated reporting systems

R2. Propose and Evaluate Strategies for Data Standardization and Visualization, either in Academia or Business

R3. Critically Define the Choice of Graphics to be used in Automated Reporting Systems
